THE DEVELOPMENT OF SCIENTIFIC ORIENTAL STUDIES AND SPECIALIZED HISTORICAL RESEARCH IN BRITISH HISTORIOGRAPHY FROM THE SECOND HALF OF THE 19TH CENTURY TO THE MID-20TH CENTURY

Yuldashaliyeva Oyistaxon Orifjon qizi
Doctoral Researcher, Fergana State University

Abstract

This article examines the principal developments in the study of early medieval Central Asian history in British historiography from the second half of the nineteenth century to the mid-twentieth century, focusing on the emergence of scholarly Oriental studies and the development of specialized historical research. It analyzes the expansion of the source base for investigating the region's political history, historical geography, ethnocultural processes, and international relations through the increasing use of written and archaeological evidence. Particular attention is paid to the collection, translation, and scholarly publication of Eastern manuscripts, the comparative examination of Chinese, Arabic, Persian, and other written sources, and the incorporation of archaeological expedition findings into historical research. The significance of source criticism, philological analysis, and historical-geographical approaches within British Oriental scholarship is considered through the contributions of Aurel Stein, H. A. R. Gibb, and other scholars. The article also addresses the influence of the colonial-era intellectual environment and the methodological limitations of scholarship during the period under consideration. It aims to provide a historiographical assessment of the transition from general historical-geographical descriptions of Central Asia to specialized, source-based studies of its early medieval history.

Keywords: British historiography, Central Asia, Early Middle Ages, second half of the nineteenth century, mid-twentieth century, scholarly Oriental studies, specialized historical research, Aurel Stein, H. A. R. Gibb, source criticism, Eastern manuscripts, historical geography, archaeological expeditions, comparative historical analysis, scholarly traditions.

The study of early medieval Central Asian history in British historiography represents a long-term historiographical process characterized by continuous changes in scholarly methodologies, the range of historical sources, and research directions. The earliest manifestations of this process appeared in English-language geographical, historical, and travel literature during the seventeenth century. In the eighteenth and nineteenth centuries, it acquired new dimensions through the institutionalization of Oriental studies, while the twentieth century witnessed the development of specialized research based on source criticism, philology, and political history. In contrast to the Soviet period, the works of British scholars in the late twentieth and early twenty-first centuries increasingly incorporated local Central Asian written sources, archaeological evidence, and numismatic materials into academic discourse. This development created opportunities to reconsider traditional interpretations of the region's early medieval history.

The early medieval history of Central Asia primarily encompasses the political, ethnic, socioeconomic, and cultural processes that took place in the region between the fourth and eighth centuries CE. In particular, the history of the Chionites, Kidarites, Hephthalites, the Turkic Khaganate, Sogdiana, Tokharistan, and the initial stages of the Arab conquests constitutes the principal subject of historiographical analysis.

In British historiography, the systematic study of Chinese written sources concerning the early medieval history of Central Asia began to emerge as a

distinct scholarly field in the second half of the nineteenth century. This process was closely associated with the growing interest in British Oriental studies in the historical geography of Eastern countries, intercultural relations, and religious and cultural interactions. In particular, the translation of Chinese Buddhist pilgrims' travel accounts into English and the scholarly analysis of their historical and geographical information created new opportunities for source-based research into Central Asian history between the fifth and eighth centuries.

From the second half of the nineteenth century, research on Central Asian history in British historiography entered a qualitatively new stage. During this period, scholars gradually moved beyond the simple description of historical sources toward their critical historical analysis. Similarly, geographical observations increasingly gave way to investigations into the origins of peoples, the formation of states, and the interpretation of political developments.

One of the earliest prominent scholars of this period was Henry Yule (1820–1889). His two-volume work, Cathay and the Way Thither: Being a Collection of Medieval Notices of China, was published in London in 1866. By collecting, translating, and annotating European sources concerning historical relations between East and West, Yule made an important contribution to historical geography. The introduction to his work discusses relations between China and Western countries, beginning with ancient Greek geographical conceptions [1].

The scholarly significance of this publication lies in its contribution to understanding Central Asia's geographical and communicative position within Eurasian history. Nevertheless, a substantial proportion of the sources presented in the work relate to the later medieval period. Therefore, it cannot be regarded as an independent study specifically devoted to the history of the fourth to eighth centuries.

During the final quarter of the nineteenth century, questions concerning the origins and migrations of nomadic peoples in Central Asia became important scholarly issues in British historiography. Particular attention was devoted to investigating the ethnic relationships between the Xiongnu, Huns, and other Eurasian peoples, their political associations, and their historical movements.

In this field, the scholarly contributions of Henry Hoyle Howorth (1842–1923) occupy a distinctive position. Howorth's interpretations of the history of the Xiongnu and Huns represent an important example of the ethnic-genealogical historiography characteristic of the late nineteenth century. His studies sought to identify relationships between the names of ancient peoples, historical accounts, and migration processes. The scholarly importance of Howorth's approach lies in his attempt to move beyond a purely territorial and geographical description of Central Asian history and to interpret it within the broader context of ethnic and political transformations across Eurasia.

The activities of Samuel Beal were particularly significant in introducing Chinese historical sources concerning early medieval Central Asia into English-language scholarship. His work Travels of Fah-Hian and Sung-Yun, Buddhist Pilgrims, from China to India, published in 1869, provided English translations of the accounts of Chinese Buddhist pilgrims dating to the fifth and sixth centuries [2]. Through these texts, information concerning the political circumstances, religious centers, historical geography, and intercultural relations of Central Asia and its neighboring territories became accessible to the European scholarly community. In particular, accounts reflecting the historical circumstances of the early sixth century acquired considerable significance as sources for studying the Hephthalite period.

Beal's two-volume work, Si-Yu-Ki: Buddhist Records of the Western World, published in 1884, represented a further stage in the development of research in

this field [3]. This publication presented an English translation of the historical and geographical observations of Xuanzang, who traveled through Central Asia to India during the seventh century. Consequently, English-language historians gained broader access to Chinese accounts concerning local principalities, Turkic political formations, religious beliefs, and cultural interactions in the region.

By the late nineteenth and early twentieth centuries, the study of Chinese sources had gradually progressed from straightforward translation and description toward critical source analysis. In this context, Thomas Watters' two-volume study, On Yuan Chwang's Travels in India, 629–645 A.D., published in 1904–1905, acquired particular importance [4]. Watters devoted considerable attention to interpreting geographical names, travel routes, and historical information contained in Xuanzang's travel accounts. His analysis of routes passing through various historical regions of Central Asia provided valuable scholarly material for clarifying the political geography of the region during the seventh century.

Nevertheless, methodological limitations characteristic of nineteenth-century historiography can also be observed in these studies. In particular, similarities between ethnonyms or the geographical proximity of peoples living in different historical periods cannot, by themselves, provide sufficient evidence of direct ethnic relationships. This issue is especially important when examining the historical connections among the Xiongnu, Huns, Chionites, Kidarites, and Hephthalites.

During the early twentieth century, British Oriental studies witnessed a further deepening of source-based historical research. Comparative analysis of Arabic and Persian historical writings, Chinese chronicles, and other written sources created opportunities for a more systematic reconstruction of Central Asia's political history.

Within this process, Hamilton Alexander Rosskeen Gibb (1895–1971) and his work The Arab Conquests in Central Asia occupy a particularly important place [5]. This monograph was published in London in 1923 by the Royal Asiatic Society. Gibb's research focused on the Arab campaigns in Central Asia during the seventh and eighth centuries, the political situation in Transoxiana, the activities of local rulers, and resistance movements involving Turkic forces.

The structure of the work itself reflects the author's scholarly approach. It systematically examines the historical circumstances of the Oxus basin, the initial Arab campaigns, the conquests of Qutayba ibn Muslim, the counteroffensives of Turkic forces, and the subsequent reestablishment of Arab authority in Transoxiana [6].

An important historiographical feature of Gibb's research is that he considered the Arab conquests not merely as a sequence of military campaigns but as developments closely connected with Central Asia's internal political relations. The author sought to illuminate interactions among local principalities, Turkic political forces, and the Caliphate. In particular, the section entitled The Turkish Counterstroke examines the political and military activities of Turkic forces opposing the Arab conquests. This demonstrates the growing importance of approaches that considered local and regional political factors in British historiography [7].

At the same time, it is essential to recognize that Gibb relied primarily on Arabic historical literature as his principal source base. Although these sources preserve valuable historical information, their political and religious contexts may have influenced the interpretation of certain events. Therefore, comparing Gibb's conclusions with local Sogdian documents, Chinese chronicles, and numismatic evidence remains an important task for contemporary historiographical research.

One of the major achievements of British historiography during the first half of the twentieth century was the gradual transformation of Central Asian history from a subject of general geographical and ethnic descriptions into an independent field of political and historical investigation.

In particular, Gibb's work became an important example of systematic source analysis in the study of seventh- and eighth-century Transoxiana. However, since his research did not directly address Hephthalite history, its significance should be associated primarily with the historiography of political developments following the Hephthalite period rather than with the history of the Hephthalite state itself.

In conclusion, the principal characteristics of this second stage in the development of British historiography were the emergence of Central Asian history as an independent scholarly field, the formulation of ethnic and political theories, and the expansion of specialized historical investigations grounded in the critical analysis of written sources. These developments contributed to the establishment of a more systematic methodological foundation for studying the political, ethnic, and cultural transformations of early medieval Central Asia.
